BIOWEED® ORGANIC

NATURAL WEEDKILLER CONCENTRATE

Active Constituent: 680g/L Pine Oil

MIXING RATES

Bioweed will work from a mix rate of 10% for small or emerging weeds and up to 20% for mature and stubborn weeds. We recommend testing between 10-15% with a bit of trial and error, learning the best efficacy on your targeted weeds.

MIXING DIRECTIONS

1. Half fill the mixing container or tank with clean water.
2. Add the appropriate measure of Bioweed concentrate.
3. Stir or agitate until evenly mixed.
4. Finish filling the tank with water.
5. Please ensure that the filling hose is below liquid surface to prevent excess foaming.

Note: As Bioweed herbicide concentrate already contains a natural, plant-based surfactant, no additional surfactant is required.

APPLICATION COVERAGE

You must entirely cover the target plant to the point of run off to achieve a complete kill. Bioweed herbicide only kills the plant material that it touches and does not trans-locate from cell to cell. Therefore, you must apply the product accurately to attain complete coverage. Best efficacy is achieved when weeds are at their youngest stage.
